Management Of Late Blight Of Potato With Fungicide Spray Intervals: Efficacy and Cost Benefit Analysis of Fungicide Spray Intervals for the Management of Late Blight of Potato Michael Tewolde

Field experiment was conducted to evaluate the effects of fungicide spray intervals on the control of potato late blight (*Phytophthora infestans* (Mont.) de Bary) on three potato varieties at Umbulowacho and Hagereselam during the 2010 cropping season from August to December under rain fed condition with natural infection. The study consisted of two released potato varieties Gudene (CIP 386423.13) moderately resistance, Jallene (CIP-384321.19) moderately susceptible and one local variety (Agazer) highly susceptible to late blight, and three Ridomil-MZ 63.5% WP spray intervals 10, 20 and 30 days at the rate of 3 kg/ha in a randomized complete block design in split plot arrangement with three replications. Varieties were assigned to the main plots and spray intervals to the sub-plots. Disease development started earlier at Umbulowacho (53 days after planting) than at Hagereselam (61 days after planting). Generally, it was observed that the effects of application of Ridomil-MZ 63.5% at different spray intervals on the tested varieties were found to be highly significant ($P < 0.01$) on total tuber yield, marketable tuber yields, total tuber number and marketable tuber numbers on both locations.
